

Transferring Weighed Solids

Crease a piece of paper, place it on the appropriate balance pan, and add masses to the scale until it balances.

Add additional masses to the balance that are equal to the mass of the solid that you desire to weigh. Transfer the appropriate mass of solid to the paper using a spoon until the scale now balances.

Remove the sample and paper holding it from the balance. Slowly pour the chemical into the container by tapping the paper with your fingers or against the side of the container.
